

BCF Rain Regulations

Questions

Example 1

Team A makes 233-8 off 45 overs.

What is **RR1**?

NB this remains a constant.

During tea it rains and on resumption there is only time for 39 more overs in the match.

What is **O2** now?

Calculate **RR1 x O2 (ORR)**

What is **VT (O2)**?

NB next whole number above **RR1 x O2**.

What is **SL (O2)**?

NB next whole number below **RR1 x O2**.

After Team B has made 35-1 (10), it rains again and as a result there is only time for 26 more overs in the match upon resumption.

What is revised **O2** now?

Calculate **RR1 x O2 (ORR)**.

What is **VT (O2)**?

NB next whole number above **RR1 x O2**.

What is **SL (O2)**?

NB next whole number below **RR1 x O2**.

BCF Rain Regulations

Example 2

Team A makes 175 all out off 37.4 overs of uninterrupted play in a 45 over match played under BCF league rules.

What is **RR1**?

NB this remains a constant.

Tea is taken between innings and Team B makes 24-1 (7) when it rains and on resumption there is more than 3 hours (ie 45 more overs of playing time) left in the match.

What is **O2** now?

What is **VT (O2)**?

What is **SL (O2)**?

Upon resumption, Team B stumbles to 45-3 (12) when it rains again and on resumption there is only enough time to play 29 more overs in the match.

What is the revised **O2** now?

Calculate **RR1 x O2 (ORR)**.

What is **VT (O2)**?

NB next whole number above **RR1 x O2**.

What is **SL (O2)**?

NB next whole number below **RR1 x O2**.

Team B continues and reaches 86-5 (23) when there is more rain and as a result an hour of playing time remains (ie 15 overs) when play resumes.

What is the further revised **O2** now?

Calculate **RR1 x O2 (ORR)**.

What is **VT (O2)**?

NB next whole number above **RR1 x O2**.

What is **SL (O2)**?

NB next whole number below **RR1 x O2**.

BCF Rain Regulations

Example 3

Team A reaches 98-3 (22) when it rains and there is time for 58 more overs play in the match upon resumption.

When play resumes it is a 40 over match ($22 + 58 = 80$, $80/2 = 40$).

Example 3a

Team A then tees off rather indiscriminately and is all out 175 (37.5), tea is immediately taken but it rains and the number of overs remaining in the match is reduced to 38 when play restarts.

What is **RR1**? NB this remains a constant.

What is **O2** now?

Calculate **RR1 x O2**.

What is **VT (O2)**?

NB next whole number above **RR1 x O2**.

What is **SL (O2)**?

NB next whole number below **RR1 x O2**.

There are no further interruptions in play and when Team B is 165-7 the no 9 batsman hits the last ball (not a no ball or wide) of the match for 6. Which team has won? Would the result be any different if the batsman had pushed a single?

Example 3b

Team A then bats a bit more sensibly and reaches 175-8 (38) when rain interrupts the match, tea is immediately taken but it rains and the number of overs remaining in the match is reduced to 38 when play restarts.

What is **RR1**? NB this remains a constant.

What is **O2** now?

What is **VT (O2)**?

What is **SL (O2)**?

There are no further interruptions in play and when Team B is 165-7 the no 9 batsman hits the last ball (not a no ball or wide) of the match for 6. Which team has won? Would the result be any different if the batsman had pushed a single?
